

Payables Approval → Auto JV → Payment Voucher

Adamrit · New "Approvals" tab inside the Tally page · Plan dated 21 July 2026

1. Problem & Goal

Every vendor bill, doctor surgery fee, and staff salary currently needs a hand-made voucher in Tally. Goal: the moment management approves a bill in Adamrit, the Journal Voucher (JV) posts automatically into the live books; when the party comes to collect money, a Payment Voucher is generated and the bill is knocked off. Three categories now: **VENDOR, DOCTOR, SALARY** (same flow, different ledgers).

Example: Vidarbha Agency, oxygen bill Rs 25,000 (INV-4521)

On Approve: Journal Voucher J0U0001 (Ref: INV-4521)	
Dr Oxygen Expenses	25,000
Cr Vidarbha Agency	25,000

On Pay: Payment Voucher PAY0001 (Ref: INV-4521, knock-off)	
Dr Vidarbha Agency	25,000
Cr HDFC Bank	25,000

2. Decisions Locked

- **YES** JVs post into the **live books** via the existing `createAccountingVoucher()` engine. They appear in Trial Balance, P&L, and the voucher register. No parallel voucher table.
- **YES** Lives entirely **inside the Tally page** as a new "Approvals" tab. No new route or sidebar entry.
- **YES** **Manual add form** now; auto-feed from payment obligations / surgeries later.
- **NO** No Tally sync in this pass.

3. What Gets Built (4 files)

File	Purpose
<code>supabase/migrations/<ts>_create_approval_queue.sql</code>	New <code>approval_queue</code> table: category, party, reference, amount, expense ledger (Dr), party ledger (Cr), invoice URL, status, links to posted JV and payment voucher. DB CHECKs: amount > 0, the two ledgers differ. RLS enabled.
<code>src/lib/approval-queue-service.ts</code>	Logic layer: <code>createApproval</code> , <code>approveAndPostJV</code> , <code>rejectApproval</code> , <code>postPaymentVoucher</code> . Claim-then-post ordering prevents duplicate vouchers.
<code>src/components/tally/TallyApprovals.tsx</code>	The Approvals tab UI: Pending / To Pay / History sections, add-bill modal, invoice preview, bulk approve.
<code>src/components/tally/TallyPage.tsx</code>	Small edit: register the new tab and render it with the same company props as other tabs.

4. Reused (Not Rebuilt)

- `createAccountingVoucher()` : validates Dr = Cr, company-scoped ledgers, auto voucher numbering (JOU / PAY series), posts voucher + entries as AUTHORISED, rolls back on failure.
- `chart_of_accounts` ledger master, `useCompanies` + company resolution from the Tally page.
- `SearchableSelect` ledger pickers, Cash/Bank filter from TallyCreateVoucher.
- `uploadBillAttachment()` for invoice photos (uploads bucket).
- `useAccountingRights()` gates the Approve and Pay buttons.

5. Screen Layout (Approvals tab)

Section	Contents
Pending	Table with row checkboxes (multi-select). Columns: category, party, reference, amount, inline "Dr Expense / Cr Party" split, invoice thumbnail. Actions: Add Bill, Approve & Post JV (single or bulk), Reject with reason, invoice preview dialog. Edit/delete allowed only while PENDING.
To Pay	Approved, unpaid bills with a posted JV. "Pay" opens a modal: choose Cash/Bank ledger + date; posts the payment voucher and marks the bill paid.
History	Paid and rejected bills, read-only.

6. Loopholes Checked & Closed

Loophole	Defense
Double-click / two users approve the same bill: duplicate JV	Atomic claim: conditional UPDATE (status PENDING to APPROVED) must affect exactly 1 row before any JV is posted; jv_voucher_id is the idempotency marker.
Double payment	Same claim guard on is_paid / payment_voucher_id.
JV posting fails midway	Engine validates and rolls back; the claim is reverted so the row returns to PENDING. No half-posted state.
Pay before the JV exists	To Pay list and the pay claim both require jv_voucher_id IS NOT NULL.
Ledger from the wrong company	company_id captured at add time and reused at posting; DB rejects foreign ledgers.
Same ledger on both sides / amount 0 or negative	DB CHECK constraints + form validation.
Editing a bill after its JV posted (books diverge)	Approved rows are locked; edit/delete only while PENDING.
Reject or pay in the wrong state	Status-guarded: reject only PENDING; pay only APPROVED and unpaid.
Bulk approve where some rows fail	Per-row handling; only successes transition, failures stay PENDING with an error toast.
Same bill entered twice	Soft duplicate warning on matching party + reference + amount.
Invoice upload fails	Invoice is optional; save proceeds with a warning.

KNOWN LIMITATIONS (FLAGGED, DEFERRED)

- Invoice photos live in the public uploads bucket (same as the rest of the app); signed URLs are a later hardening step.
- Cancelling a posted JV from the voucher register does not auto-revert the approval row (no reversing entry yet).
- No partial or multi-bill payments; Pay settles the full bill amount.

7. Verification Checklist

- Apply migration; confirm table, CHECKs, RLS.
- Open Tally page, Approvals tab; add a VENDOR bill (Vidarbha) with invoice photo; verify preview + Dr/Cr split.
- Approve: JV appears in voucher register and Trial Balance, balanced. Double-click approve: still only one JV.
- Pay via Cash/Bank: payment voucher posts, row marked paid, reference links the bill. Pay again: blocked.

- Repeat for DOCTOR and SALARY. Reject path: no voucher, reason stored. Invalid inputs (same ledger both sides, amount 0): blocked.
