

Dialysis Treatment Sheet / Session Chart Plan

Summary

Build a proper Dialysis module under Patient Care that stores one row per dialysis session, links it to existing patients and visits, captures clinical session details, and keeps NephroPlus payout accurate.

Use the existing `dialysis_sessions` and `dialysis_rate_config` migrations as the base instead of creating an unrelated new register.

Default choices: v1 will include session chart, vitals, and billing link. When a dialysis session is completed, it will create or update the matching dialysis charge in `visit_clinical_services`.

Key Changes

- Add route/sidebar item for `/dialysis-sessions`, separate from the existing `/nephroplus` payout report.
- Create a Dialysis Sessions page with date filter, patient search, status filter, daily session list, add/edit session dialog, patient-wise history view, and print/export option.
- Extend `dialysis_sessions` to store clinical chart fields: `visit_uuid`, `shift`, `status`, `start_time`, `end_time`, `duration_minutes`, `machine_no`, `dialyzer_no`, `technician`, `doctor`, `pre/post BP`, `pre/post weight`, `heparin`, `UF goal`, `UF removed`, `vascular access`, `complications`, `notes`, and linked billing row id.
- Keep existing financial fields in `dialysis_sessions`: `charged_price`, `payer_type`, `service_category`, `hope_share`, and `nephroplus_share`.

Data Flow

- User selects an existing patient and optionally an existing visit.
- Module auto-fills patient name, patient id, visit date/type where available.
- User records session details and marks status as completed.
- On completed save, find active dialysis clinical service from `clinical_services` where service name contains dialy.
- Insert or update `visit_clinical_services` with quantity 1, selected rate, amount, and rate type.
- Save that billing row id back to `dialysis_sessions.linked_visit_clinical_service_id`.
- NephroPlus report should prefer `dialysis_sessions` for completed sessions and fall back to current billing query only for older billing-only data.

UI Behavior

- Dialysis Sessions page is the working module for staff.
- NephroPlus Dialysis remains the payout and settlement report.
- Daily list columns: date/time, patient, visit id, shift, machine, technician, status, amount, and actions.
- Patient history shows all previous dialysis sessions with vitals and billing amount.
- Print format includes hospital header, patient details, session vitals, dialysis details, notes, and signature placeholders.

Test Plan

- Verify new session can be created for existing patient and visit.
- Verify completed session creates one dialysis billing charge.
- Verify editing completed session updates linked charge and does not duplicate the charge.
- Verify cancelled and planned sessions do not affect billing or NephroPlus payout.
- Verify NephroPlus report includes completed session data and still shows old billing-only dialysis records.
- Verify filters: date, patient search, status, and shift.
- Run TypeScript build and basic UI smoke test for `/dialysis-sessions` and `/nephroplus`.

Assumptions

- V1 uses session plus vitals scope, not a full ICU-style dialysis prescription chart.
- Completed session should auto-create or update billing.
- One dialysis session equals billing quantity 1.
- Existing dialysis_sessions and dialysis_rate_config are intended to be reused.
- Existing NephroPlus page should not be removed; it becomes the settlement report.
